

CSC1005/CSC1022 Database Lab

Lab 1: Getting Started

Goal: Learn how to use and navigate the MySQL Workbench.

You have finished the lab when you are familiar with accessing different databases and can display data from tables.

Section 1: Load MySQL Workbench

Step1: Login into Windows with your usual log in details. In the Start menu find MySQL Workbench.

Step 2: Once the workbench is open, we need to create a connection to connect the database. Click on the '+' icon after the MySQL Connections.

Step 3: Create the connection. Name the connection, for example 'CSC1005'. The hostname is: student.computing.dcu.ie, the port is 3306. Enter the username/password you received before the lab (click Store in Vault... to enter the password).

Step 4: Open MySQL workbench.

The MySQL database can have many database schemas and we have 4 created for labs and the lab exam.

Section 2: Query Practice

*Be sure to set **Sakila** as default schema. Right-click on **Sakila** and choose: "Set as Default Schema".*

Type in the following queries and observe their behaviour. Write down what happens after each query. In some cases, you will be asked questions.

Q1.

```
SELECT * FROM sakila.actor where first_name = "michael";
```

Each student will have a unique "world____" schema. Find the corresponding number in the schema navigator panel to the left.

*Set **world____** as default schema.*

Q2.

```
SELECT * FROM City where ID = 15;
```

Q3.

```
SELECT Name, ID FROM City where ID = 15;
```
