

CSC1005/CSC1022 Database Lab

Lab 4: Nested SQL and Group By

Goal: Learn aggregate and nested SQL syntax and how to write your basic queries.

This lab is designed to get students familiar with a bit of complex queries. You get to practice group by, aggregate functions and nested queries.

You have finished the lab when you have finished all queries.

If queries specify using a subquery or nested query, you must use a nested query.

Section 1. Basketball (Make default database)

1. Return the year and the average wins of the NBA teams after the 1990 season only when this average is less than 40 (Hint: Group By required)
2. Find all the basketball coach IDs with more than 900 of wins, order by ascending number of losses (Hint: Group By required)
3. Print the players (playerID) of the Miami 1998 team with over 1200 minutes played. Use a nested query in your answer. (Challenge: Can you display the player names as well?)

Section 2: Sakila (Make Sakila the default database)

4. Return the title and the description of the movie having length of at least 2 hours and containing the word 'wrestler' in the description and 'agent' in the title
5. How many movies last more than 3 hours?
6. Select the title and rating of suitable films from the 'Children' category using a nested query. (Hint: you have to use nested queries with multiple tables)

Section 3. World (Make default database)

7. Count how many cities are located in a European country with more than 90 million inhabitants? Use a nested query.
 8. Return the count and average life expectancy of the countries grouped by continent of origin with an average life expectancy greater than 45 years. (Hint: Group By required)
 9. Count the total number of people in all the countries whose official language is Spanish. Use a nested query.
