

CSC1005/CSC1022 Database Lab

Lab 5: SQL Joins and ANY/ALL

Goal: Learn SQL joins syntax and how to write queries using ANY / ALL.

This lab is designed to get students familiar with using multiple tables and joins to retrieve results.

You have finished the lab when you have finished all queries.

If queries specify using a join, you must use a join

Section 1. Basketball (Make default database)

1. Find the NBA Coach of the Year IN 1995 and the number of games won
2. Return the id of the player who in 1997 scored more than 1000 points and in 1996 played for Chicago Bulls and got more than 350 rebounds. **(Difficulty : Hard)**

(Hint: You could need to join the same table twice. You need to obtain the players' ID list matching the requirements for 1997, and the list for 1996. The inner join will give you the final player. You need to join again with another table to ensure the correct name of the team.)

Section 2: Sakila (Make Sakila the default database)

3. List customers (customer id) whose total payments are less than at least one other customer's total payments. Order by Total payments (Hint: Use **payment table**)
4. Return the actors full name in any movie containing the word '**pirates**' in the title.
5. Return the count and the last name of the actor starring in the most number of films **(Difficulty : Hard)**

(Hint: You may have to use nested query and group by and ANY / ALL keywords)

Section 3. World (Make default database)

6. Select countries whose population is greater than every country in the 'Caribbean' region. Display country name and the population. (Use ANY / ALL / SOME keyword)
7. **Using JOIN**, get the name and the population of the Irish city with more than 200,000 inhabitants. (you can also practice using a nested query)
8. Return the name of the countries where English is the official language, the form of government is Republic and life expectancy is greater than 70 years. (Use Join)
(Hint: You need to join two tables)
