- How do we convert from a conceptual (E-R) schema to a Relational (MySQL) schema?
- After E-R modelling, the next step is the *logical database design* or *data model mapping* step.
- We need a *methodology* to create a **Relational** schema from an **Entity-Relationship** (ER) schema.
- Tools exist which use ER diagrams to develop the schema graphically and automatically convert it into a relational database schema.
- For Reference, you can follow this video, which takes a similar example of our company ER Model:

https://youtu.be/xQRRf5fOAt8?si=Ky0QLxhzl6y_96R

Binary M:N
Relationship Types](#)

[Step 6: Mapping of
Multivalued Attributes](#)

[Step 7: Mapping of
N-ary Relationship
Types](#)

- The COMPANY database example illustrates the mapping procedure (see Figure 1).
- We describe the steps of an algorithm for ER-to-Relational mapping.
- We assume that the mapping will create tables with simple *single-valued attributes*.
- The relational model constraints which include primary keys, unique keys (if any), and referential integrity constraints on the relations, will also be specified in the mapping results.

Introduction

[Step 3: Mapping of Binary 1:1 Relationship Types](#)

[Step 4: Mapping of Binary 1:N Relationship Types](#)

[Step 5: Mapping of Binary M:N Relationship Types](#)

[Step 6: Mapping of Multivalued Attributes](#)

[Step 7: Mapping of N-ary Relationship Types](#)

Figure 1: ER Conceptual schema for the COMPANY database

Step 1. Mapping Regular Entity Types

- 1 For each regular (strong) entity type E in the E-R schema, create a relation R that includes all simple attributes of E .
- 2 Include *only* the simple *component* attributes of a composite attribute.
- 3 Choose one of the key attributes of E as the primary key for R .
- 4 If the chosen key of E is a composite, its set of simple attributes will together form the primary key of R .

[Introduction](#)

[Step 1: Mapping of
Regular Entity Types](#)

[Step 2: Mapping of
Weak Entity Types](#)

[Step 3: Mapping of
Binary 1:1
Relationship Types](#)

[Step 4: Mapping of
Binary 1:N
Relationship Types](#)

[Step 5: Mapping of
Binary M:N
Relationship Types](#)

[Step 6: Mapping of
Multivalued Attributes](#)

[Step 7: Mapping of
N-ary Relationship
Types](#)

- If multiple keys were identified for E , each additional key is recorded.
- In this example, create the relations EMPLOYEE, DEPARTMENT, and PROJECT in Figure 9 to correspond to the regular entity types EMPLOYEE, DEPARTMENT, and PROJECT.
- The foreign key and relationship attributes will be added during subsequent steps.

- Choose PPS, Dnumber, and Pnumber as primary keys for relations EMPLOYEE, DEPARTMENT, and PROJECT, respectively.
- Knowledge that Dname of DEPARTMENT and Pname of PROJECT are secondary keys should be kept for possible use later.
- Relations created from the mapping of entity types are called **entity relations** because each tuple represents an *entity instance*.

End of Step 1

EMPLOYEE

Fname	Minit	Lname	<u>PPS</u>	Bdate	Address	Sex	Salary	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_start_date
-------	----------------	----------------

PROJECT

Pname	<u>Pnumber</u>	Dnum
-------	----------------	------

Step 2. Mapping of Weak Entity Types

Inputs: E , the strong entity; W , the weak entity.

- For each weak entity type W in the E-R schema with owner entity type E :
 - create a relation R ;
 - include all simple attributes (or simple components of composite attributes) of W as attributes of R .
- Include as foreign key attributes of R :
the primary key attribute(s) of the relation(s) that correspond to the owner entity type(s).
- This takes care of mapping the identifying relationship type of W .

[Introduction](#)

[Step 1: Mapping of
Regular Entity Types](#)

[Step 2: Mapping of
Weak Entity Types](#)

[Step 3: Mapping of
Binary 1:1
Relationship Types](#)

[Step 4: Mapping of
Binary 1:N
Relationship Types](#)

[Step 5: Mapping of
Binary M:N
Relationship Types](#)

[Step 6: Mapping of
Multivalued Attributes](#)

[Step 7: Mapping of
N-ary Relationship
Types](#)

- The primary key of R is the combination of the primary key(s) of the owner(s) and the partial key of the weak entity type W , if any.
- If there is a weak entity type $E2$ whose owner is also a weak entity type $E1$, then $E1$ should be mapped before $E2$ to determine its primary key *first*.

- Create the relation **DEPENDENT** to correspond to the weak entity type **DEPENDENT**.
- Include the primary key **PPS** from **EMPLOYEE** (owner entity type), as a foreign key attribute of **DEPENDENT**; rename it **EMP_PPS**.
- The primary key of the **DEPENDENT** relation is the combination {**EMP_PPS**, **Dependent_name**}, because **Dependent_name** is the partial key of **DEPENDENT**.

End of Step 2

Figure 3: Weak Entities become Tables with Relationship to Strong Entities

Step 3. Mapping of Binary 1:1 Relationship Types

- For each binary 1:1 relationship type R in the E-R schema, identify the relations S and T that correspond to the entity types participating in R .
- There are three possible approaches:
 - (1) the **foreign key** approach,
 - (2) the **merged relationship** approach, and
 - (3) the **cross-reference** or relationship relation approach.
- The first approach is the most useful and should be followed unless special conditions exist.

[Introduction](#)

[Step 1: Mapping of
Regular Entity Types](#)

[Step 2: Mapping of
Weak Entity Types](#)

[Step 3: Mapping of
Binary 1:1
Relationship Types](#)

[Step 4. Mapping of
Binary 1:N
Relationship Types](#)

[Step 5. Mapping of
Binary M:N
Relationship Types](#)

[Step 6. Mapping of
Multivalued Attributes](#)

[Step 7. Mapping of
N-ary Relationship
Types.](#)

1. Foreign key Approach

- Choose one of the relations, say S , and include as a foreign key in S the primary key of T .
- It is better to choose an entity type with total participation in R in the role of S .
- Include all the simple attributes (or simple components of composite attributes) of the 1:1 relationship type R as attributes of S .

- Map the 1:1 relationship type MANAGES (figure 1) by choosing the participating entity type DEPARTMENT to serve in the role of S because its participation in the MANAGES relationship type is **total** (every department has a manager).
- Include the primary key of the EMPLOYEE relation as foreign key in the DEPARTMENT relation and rename it `Mgr_PPS`.
- Include the simple attribute `Start_date` of the MANAGES relationship type in the DEPARTMENT relation and rename it `Mgr_start_date` (Figure 9).

[Introduction](#)

[Step 1: Mapping of
Regular Entity Types](#)

[Step 2: Mapping of
Weak Entity Types](#)

[Step 3: Mapping of
Binary 1:1
Relationship Types](#)

[Step 4: Mapping of
Binary 1:N
Relationship Types](#)

[Step 5: Mapping of
Binary M:N
Relationship Types](#)

[Step 6: Mapping of
Multivalued Attributes](#)

[Step 7: Mapping of
N-ary Relationship
Types](#)

- Note that it is possible to include the primary key of S as a foreign key in T instead.
- This amounts to having a foreign key attribute, say `Department_managed` in the `EMPLOYEE` relation, but it will have a `NULL` value for employee tuples who do not manage a department.
- If only 2 percent of employees manage a department, then 98 percent of the foreign keys would be `NULL` in this case.
- Another possibility is to have foreign keys in both relations S and T redundantly, but this creates redundancy and incurs a penalty for consistency maintenance.

2. Merged Relation Approach

- An alternative mapping of a 1:1 relationship type is to merge the two entity types and the relationship into a single relation.
- This is possible when **both participations** are *total*, as this would indicate that the two tables will have the exact same number of tuples at all times.

3. Cross-reference or Relationship Relation Approach

- This option creates a third relation R for the purpose of cross-referencing the primary keys of the two relations S and T representing the entity types.
- This approach is required for $M:N$ relationships.
- The relation R is called a **relationship relation** as each tuple in R represents a relationship instance that relates one tuple from S with one tuple from T .

- The relation R will include the primary key attributes of S and T as foreign keys to S and T .
- The primary key of R will be one of the two foreign keys, and the other foreign key will be a unique key of R .
- The drawback is having an extra relation, and requiring an extra join operation when combining related tuples from the tables.

End of Step 3

EMPLOYEE

Fname	Minit	Lname	PPS	Bdate	Address	Sex	Salary	Dno
-------	-------	-------	-----	-------	---------	-----	--------	-----

DEPARTMENT

Dname	Dnumber	MGR_PPS	Mgr_start_date
-------	---------	---------	----------------

PROJECT

Pname	Pnumber	Dnum
-------	---------	------

DEPENDENT

EMP_PPS	Dependent_name	Sex	Bdate	Relationship
---------	----------------	-----	-------	--------------

Introduction

Step 1: Mapping of
Regular Entity Types

Step 2: Mapping of
Weak Entity Types

Step 3: Mapping of
Binary 1:1
Relationship Types

Step 4. Mapping of
Binary 1:N
Relationship Types

Step 5. Mapping of
Binary M:N
Relationship Types

Step 6. Mapping of
Multivalued Attributes

Step 7. Mapping of
N-ary Relationship
Types.

4: Mapping of Binary 1:N Relationship Types

- For each regular binary 1:N relationship type R , identify the relation S that represents the participating entity type at the N -side of the relationship type.
- Include as foreign key in S the primary key of the relation T that represents the other entity type participating in R .
- Use this approach, as each entity instance on the N -side is related to *at most one* entity instance on the 1-side of the relationship type.
- Include any simple attributes (or simple components of composite attributes) of the 1:N relationship type as attributes of S .

- Map the 1:N relationship types WORKS_FOR, CONTROLS, and SUPERVISION from Figure 1.
- For WORKS_FOR, we include the primary key `Dnumber` of the DEPARTMENT relation as foreign key in the EMPLOYEE relation and call it `Dno`.
- For SUPERVISION, we include the primary key of the EMPLOYEE relation as foreign key in the EMPLOYEE relation itself (it's recursive) and call it `Super_PPS`.
- The CONTROLS relationship is mapped to the foreign key attribute `Dnum` of PROJECT, which references the primary key `Dnumber` of the DEPARTMENT relation.

End of Step 4

EMPLOYEE

Fname	Minit	Lname	PPS	Bdate	Address	Sex	Salary	Super_PPS	Dno
-------	-------	-------	-----	-------	---------	-----	--------	-----------	-----

DEPARTMENT

Dname	Dnumber	MGR_PPS	Mgr_start_date
-------	---------	---------	----------------

DEPT_LOCATIONS

Dnumber	Dlocation
---------	-----------

PROJECT

Pname	Pnumber	Dnum
-------	---------	------

DEPENDENT

EMP_PSS	Dependent name	Sex	Bdate	Relationship
---------	----------------	-----	-------	--------------

Introduction

Step 1: Mapping of
Regular Entity Types

Step 2: Mapping of
Weak Entity Types

Step 3: Mapping of
Binary 1:1
Relationship Types

Step 4: Mapping of
Binary 1:N
Relationship Types

Step 5: Mapping of
Binary M:N
Relationship Types

Step 6: Mapping of
Multivalued Attributes

Step 7: Mapping of
N-ary Relationship
Types

Step 5: Mapping of Binary M:N Relationship Types

- For each binary $M:N$ relationship type R , create a new relation S to represent R .
- Include as foreign key attributes in S the primary keys of the relations that represent the participating entity types;
- The combination will form the primary key of S .
- Also include any simple attributes of the $M:N$ relationship type (or simple components of composite attributes) as attributes of S .

Always requires a New Table

- Note that it is not possible to represent an $M:N$ relationship type by a single foreign key attribute in one of the participating relations (as with $1:1$ or $1:N$ relationship types) because of the $M:N$ cardinality ratio.
- It is always necessary create a separate relationship relation S .

- In the case study, map the *M:N* relationship type WORKS_ON (Fig 1) by creating the relation WORKS_ON in Figure 9.
- Include the primary keys of the PROJECT and EMPLOYEE relations as foreign keys in WORKS_ON and rename them Pno and EMP_PPS, respectively.
- Include an attribute Hours in WORKS_ON to represent the Hours attribute of the relationship type.
- The primary key of the WORKS_ON relation is the combination of the foreign key attributes {EMP_PPS, Pno}.

End of Step 5

[Step 2: Mapping of Weak Entity Types](#)

[Step 3: Mapping of Binary 1:1 Relationship Types](#)

[Step 4: Mapping of Binary 1:N Relationship Types](#)

[Step 5: Mapping of Binary M:N Relationship Types](#)

[Step 6: Mapping of Multivalued Attributes](#)

[Step 7: Mapping of N-ary Relationship Types](#)

Figure 6: M-N Relationships

Step 6: Mapping of Multivalued Attributes

- For each multivalued attribute A , create a new relation R .
- This relation R will include an attribute corresponding to A , plus the primary key attribute K (as a foreign key in R) of the relation that represents the entity type or relationship type that has A as a multivalued attribute.
- The primary key of R is the combination of A and K .
- If the multivalued attribute is composite, include its simple components.

Relationship Types](#)

[Step 5: Mapping of
Binary M:N
Relationship Types](#)

[Step 6: Mapping of
Multivalued Attributes](#)

[Step 7: Mapping of
N-ary Relationship
Types](#)

- Create a relation DEPT_LOCATIONS.
- The attribute `Dlocation` represents the multivalued attribute LOCATIONS of DEPARTMENT; `Dnumber` (as foreign key) represents the primary key of the DEPARTMENT relation.
- The primary key of DEPT_LOCATIONS is the combination of {`Dnumber`, `Dlocation`}.
- A separate row will exist in DEPT_LOCATIONS for each department's location.

[Step 4: Mapping of Binary 1:N Relationship Types](#)

[Step 5: Mapping of Binary M:N Relationship Types](#)

[Step 6: Mapping of Multivalued Attributes](#)

[Step 7: Mapping of N-ary Relationship Types](#)

- Figure 9 showed the COMPANY relational database schema obtained with steps 1 through 6.
- There is no mapping of n -ary relationship types ($n > 2$) because none exist in figure 1.
- These are mapped in a similar way to $M:N$ relationship types by including the following additional step in the mapping algorithm.

Step 7: Mapping of N -ary Relationship Types.

- For each n -ary relationship type R , where $n > 2$, create a new relation S to represent R .
- Include as foreign key attributes in S the primary keys of the relations that represent the participating entity types.
- Include any simple attributes of the n -ary relationship type (or simple components of composite attributes) as attributes of S .
- The primary key of S is usually a combination of all the foreign keys that reference the relations representing the participating entity types.
