

MAKING the DRAFT SRS DOCUMENT

Using the SRS template based on IEEE 830-1998 standard, in this first group submission a partial draft will be made in view of completing it for the second submission.

1. **With the team members, decide on the system** Team first needs to identify the app/service/system to analyse in this project (e.g. AIB banking app, YouTube, Gmail, Remitly, Spotify, Zoom...). Each team should email Vi and Hyowon the list of member names & emails and the chosen system/service/app. If it is suitable it will be approved and will be listed in Google Sheets (deadline 05/Oct/2025):
https://docs.google.com/spreadsheets/d/1YuuPz9Zvs0x_WJ5gXDAq2nQKQnle6rlXVmjIzeeN4QA/edit?usp=sharing

Every team needs to choose a unique app/service/system.

2. Create a stakeholder model for the system to be studied

Follow the guidance from the slides and literature to elaborate a model with all relevant stakeholders. It should be easy to identify at least 20 stakeholders and develop a hierarchy of at least three levels (as an hierarchical diagram). Also make a stakeholder matrix (or individual tabular representations per stakeholder) where you denote their role, functions, motivation, main concern, availability, and relations to other stakeholders. Consider the various domains stakeholders could be included from and what types of information you would need to make as good and as complete a requirements specification as you can. Everybody who can provide you with knowledge beneficial for the system, and therefore your requirements specification, should be represented in your model.

3. Create goal model for the system to be studied

The goal model should consolidate all the different goals that the earlier identified stakeholders to have into one overview. That way they can be discussed and conflicts become visible. Furthermore, trade-offs and cross-relations can be identified, some of which might be useful, while others might impose problems for the system's development (constraints).

Use the classification of business goals (context of the system, what are you building it for, why will people want to use it), usage goals (what the functionality will be), and system goals (quality or technical aspects). Find a way to connect from the business goals down to the usage goals (derive usage goals from business goals) and then from usage goals to system goals (derive system goals from usage goals). Make sure your goal model contains at least 3 goals each of business goals, usage goals and system goals and at least 12 goals in total.

Put them into a hierarchy with sub-goal relationships. Use appropriate notations (goal categories, labeled relations for decomposition, supports and conflicts). Also make sure you identify at least one (potential) goal conflict. Diagrams have to be accompanied by explanatory text, a few paragraphs that help understand how to read and understand your diagram and the goals in there. In that description, also make clear which stakeholder is the issuer of that goal.

4. Create a System Vision picture for the system to be studied

Diagrams have to be accompanied by explanatory text. Please write a few paragraphs that help understand how to read and understand your diagram and the goals in there. In the description, also make clear which stakeholder is the issuer of that goal.

5. Create 3 initial key Use Cases for the system to be studied

These must be in UML notation. It should include:

- a) A UML Use Case overview diagram
- b) 3 detailed use cases using a table for each one (check Week 6 material).

6. Put them all in the right places in SRS document template

Add the models and pictures created along with commentary into the SRS document template provided to complete a draft of sections 1, 2 and 3.2.

GROUP PROJECT 1

Things to consider:

You should focus on the yellow bits in the template. While you should attempt at completing all sections, you can write "not applicable" if you think that is appropriate (especially in section 2 this may happen a lot). No section should be more than 2 paragraphs (except maybe Sec 2.5 Assumptions), many sections will only be 1-2 lines. Make sure to give enough context for someone who may not be familiar with the app or service to read the doc and understand it. The key sections you should focus on will be evident from the highlighting and what you have learned so far. To help you plan, the breakdown of the marks will be as follows according to the rubric:

- Stakeholder model 20%
- Goal model 20%
- System vision 20%
- Use cases 20%
- SRS document overall (i.e. material not listed above) 20%

On the first page in addition to the names of the people who wrote the document, list each group member's contributions (just 1-2 lines). People who do not contribute should not be listed and will score 0.

SUBMISSION

Turn the Word template into PDF document and submit via the Loop assignment.

Submission Deadline: 11:59pm, 25th October 2025

GRADING RUBRIC

Use the following rubrics to strengthen the submission – for each of the criteria (component) in the rubric, its **completeness**, **correctness** and **understandability** will be assessed – check out the full rubric description on Loop. The submission is **15%** of the module grade.

Area	Marks
Stakeholder Model	0 - 3
Goal Model	0 - 3
System Vision	0 - 3
Use Cases	0 - 3
SRS Documentation	0 - 3
